
SOCIAL ENGINEERING PHISHING SIMULATION

By : Imane TOUIBA

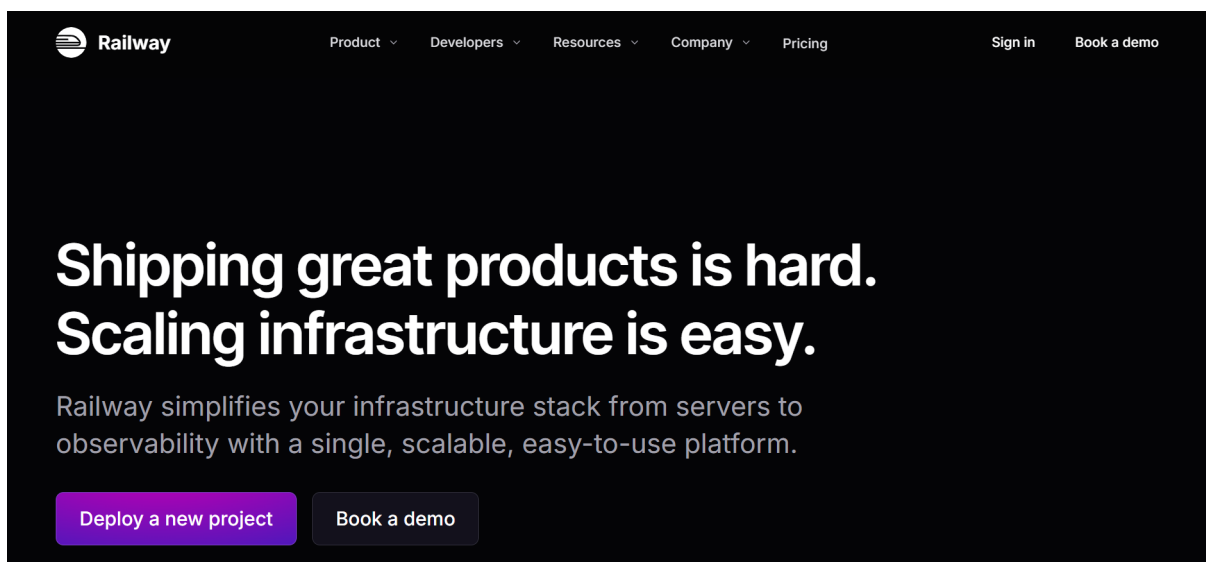

April 19, 2025

1 Introduction

Phishing remains one of the most prevalent cyber threats, exploiting human psychology to bypass technical defenses. With over 90% of data breaches originating from phishing attacks, organizations must prioritize employee awareness and proactive testing. GoPhish, an open-source phishing framework, enables security teams to simulate realistic attacks, assess vulnerabilities, and train users to recognize malicious emails. By deploying GoPhish, this project demonstrates how controlled phishing simulations can strengthen an organization's security posture while measuring employee susceptibility to social engineering tactics.

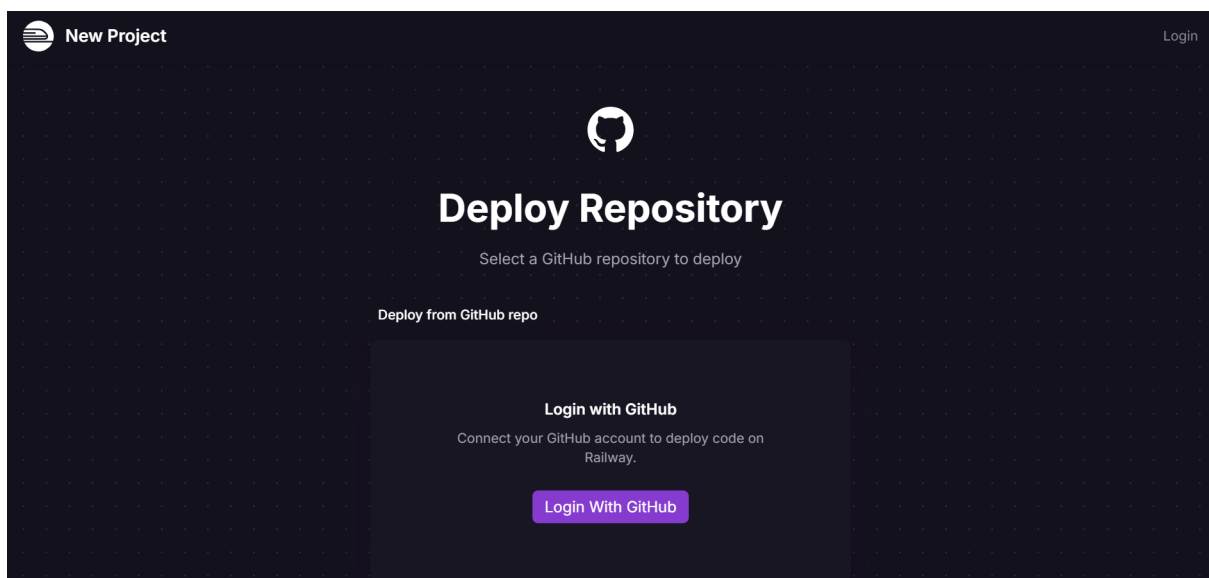

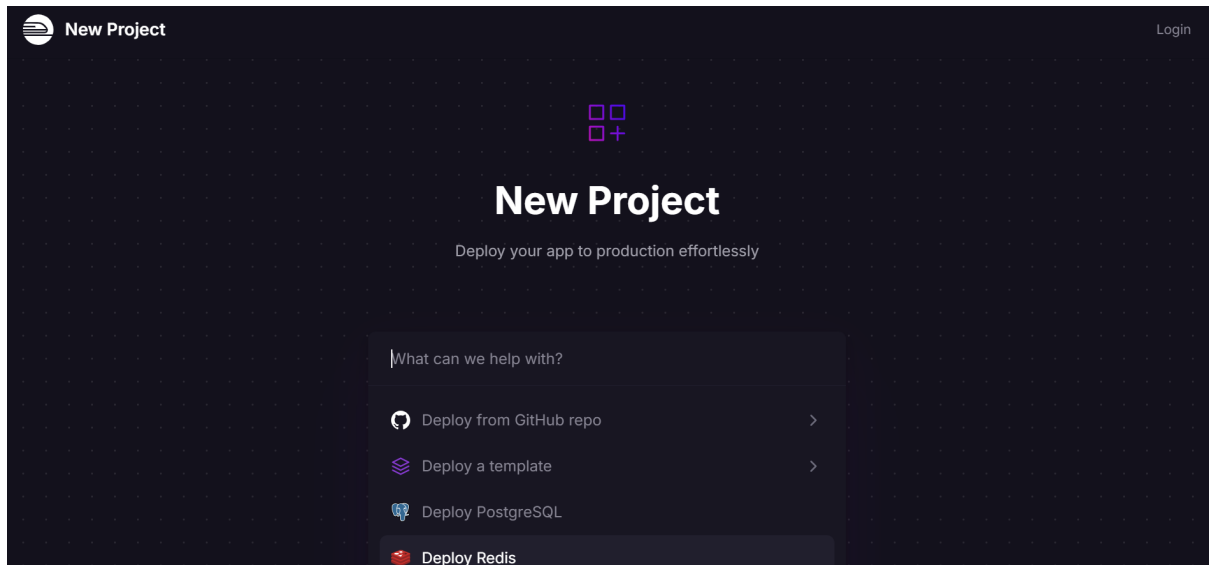

2 Environment Setup

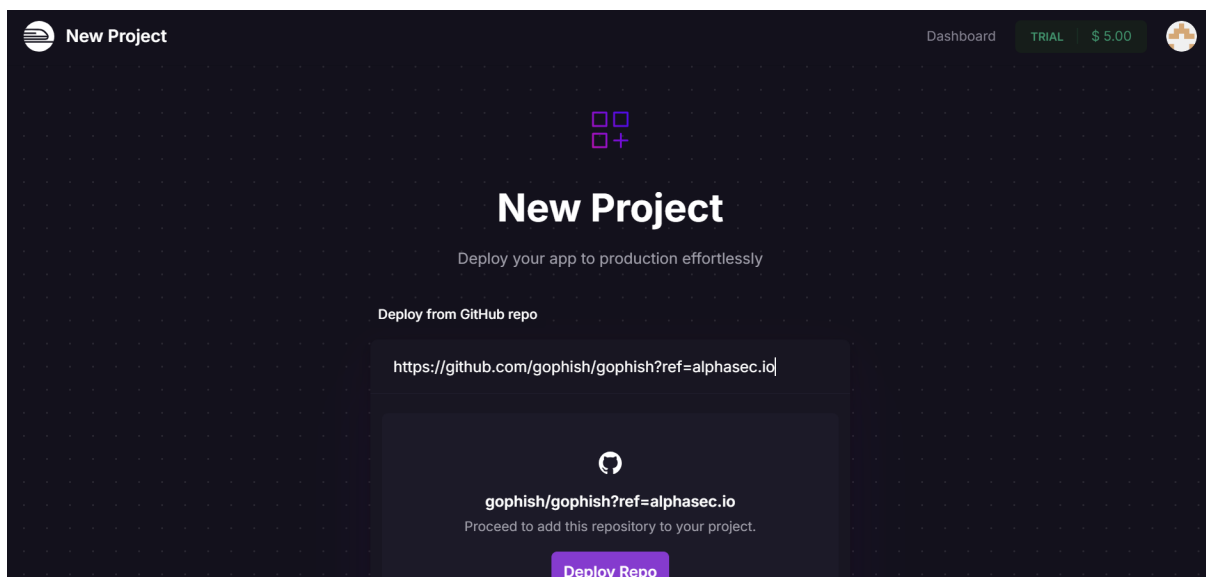

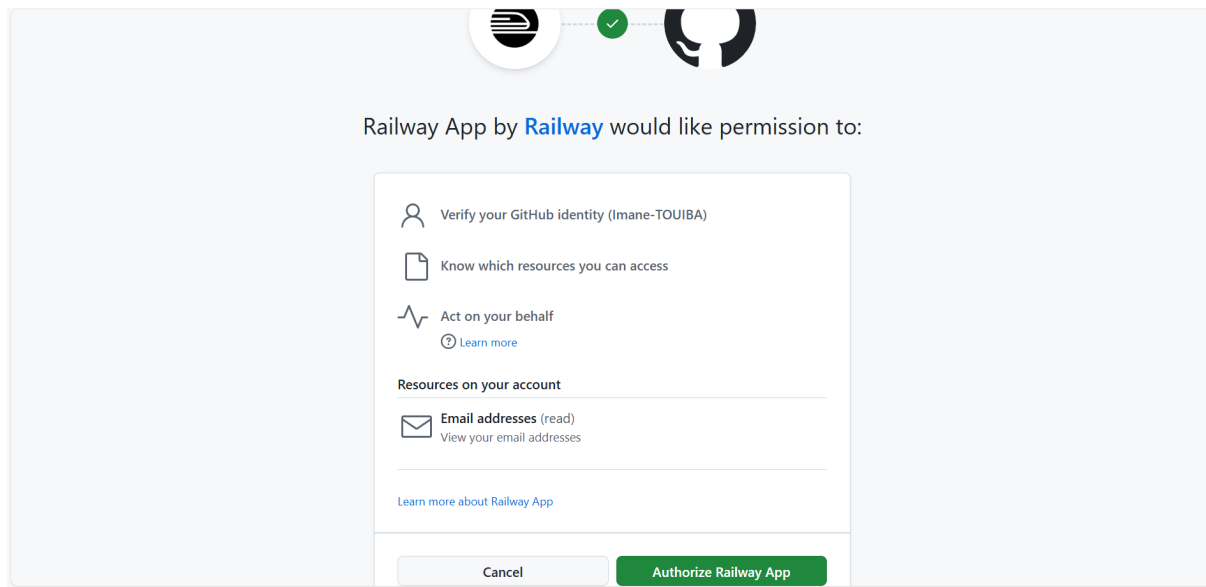

Since emails may be blocked if sent directly from a local machine, I deployed Gophish on Railway (a cloud platform) for reliable email delivery.

2.1 Deployment via GitHub Repository

Used the official Gophish GitHub repository (<https://github.com/gophish/gophish>)
Connected the repository to Railway for automated deployment.
Railway built and deployed the Gophish instance.

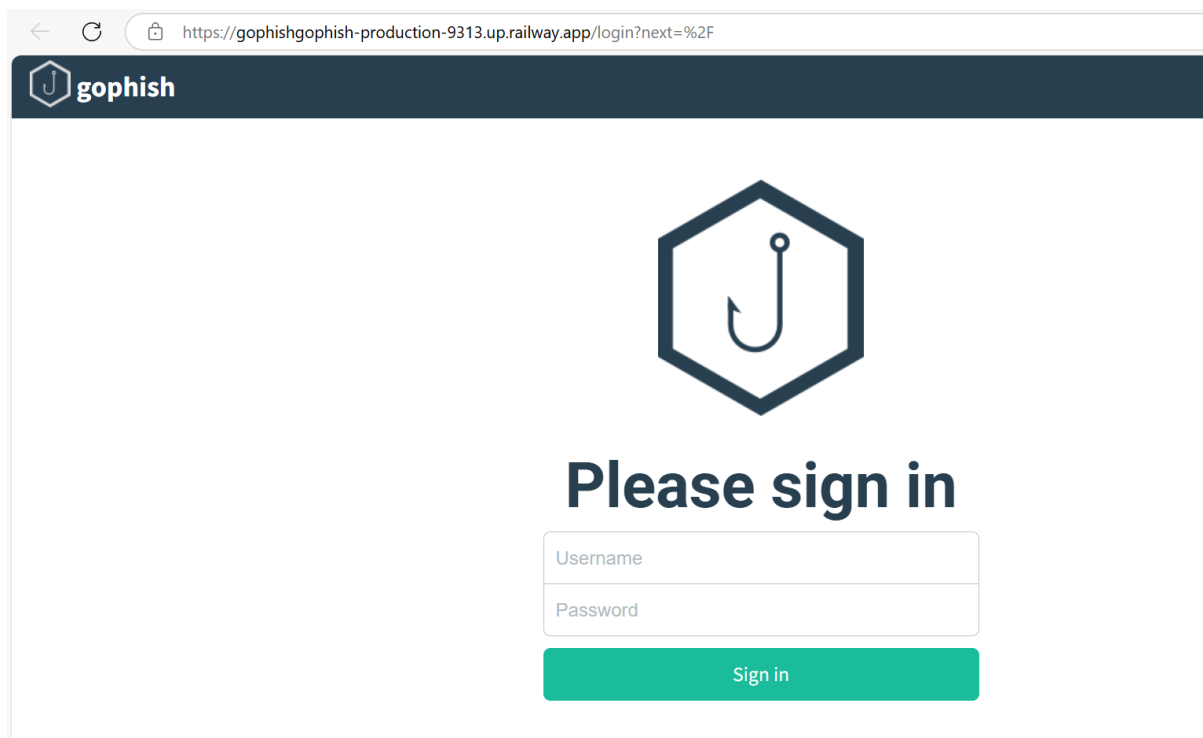

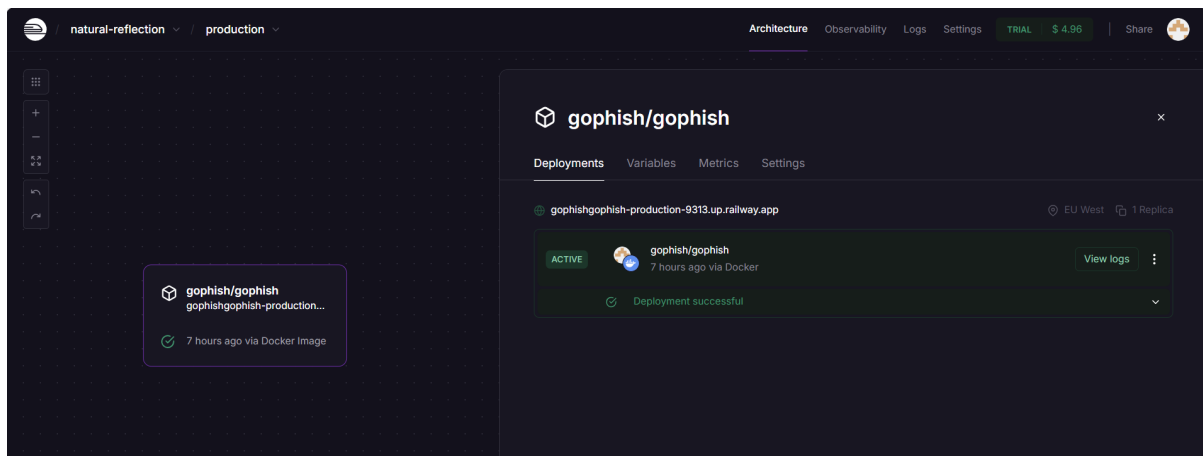

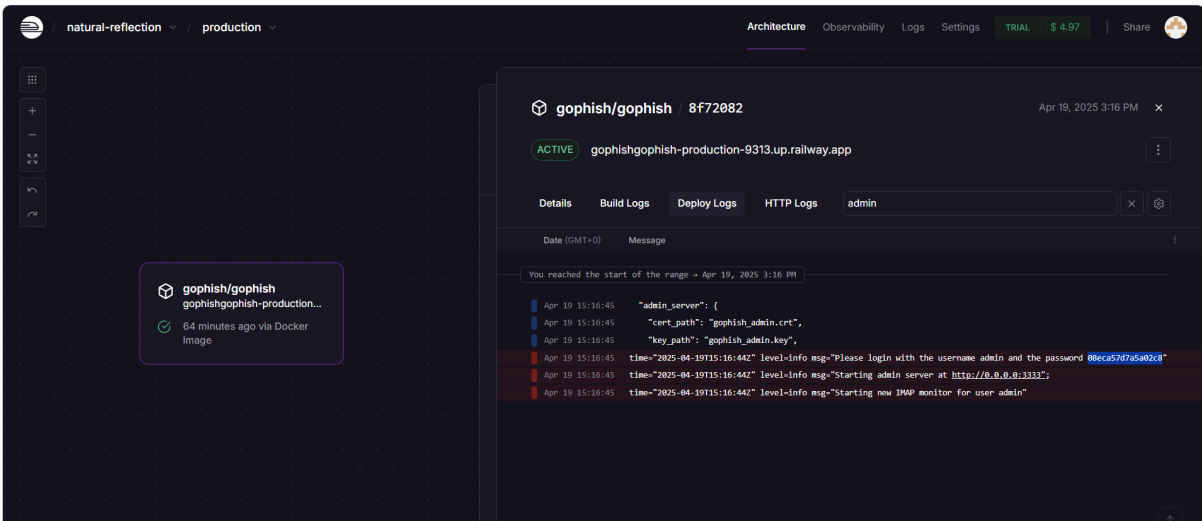

2.2 Accessing Gophish

After deployment, Railway provided a public URL for the Gophish server.

Navigated to the URL in a web browser to access the Gophish dashboard.

Retrieved login credentials (admin username and password) from Railway's logs or environment variables.

3 PyPhisher

```
[Imane@kali] - [~/Downloads/PyPhisher-main]
$ sudo docker run --rm -it kasroudra/pyphisher
[sudo] password for Imane:
/PyPhisher/pyphisher.py:133: SyntaxWarning: invalid escape sequence '\ '
    """
/PyPhisher/pyphisher.py:133: SyntaxWarning: invalid escape sequence '\|'
    """
/PyPhisher/pyphisher.py:133: SyntaxWarning: invalid escape sequence '\_'
    """
/PyPhisher/pyphisher.py:133: SyntaxWarning: invalid escape sequence '\_'
    """

4 Gophish configuration

After logging in, I configured the following components for the phishing campaign:

Groups and Users Purpose: Define the target recipients.

Action Taken:

Created group "MyGroup" containing 2 test users.

Manually added target emails (There is also the possibility to import a CSV file containing target emails).

Edit Group

Name:

[+ Bulk Import Users](#) [Download CSV Template](#)

First Name Last Name Email Position [+ Add](#)

Show entries Search:

Landing Page Integration Page Name: "LinkedIn"
Source: Pyphisher-generated page hosted at: <https://124a7be7c289ab86914eb1b50bbafa82.serveo.net/login.html.php>

SMTP Server: Gmail (smtp.gmail.com:25)

Sender Identity: My email address

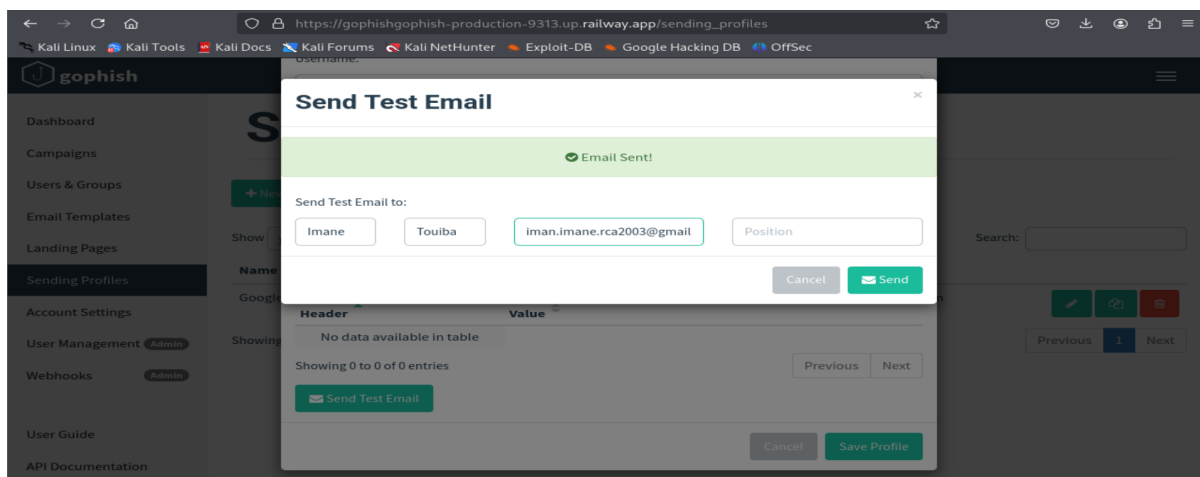

Security Note: Certificate errors ignored (not recommended for production)

The screenshot shows the 'Edit Sending Profile' modal in the GoPhish application. The modal contains the following fields and options:

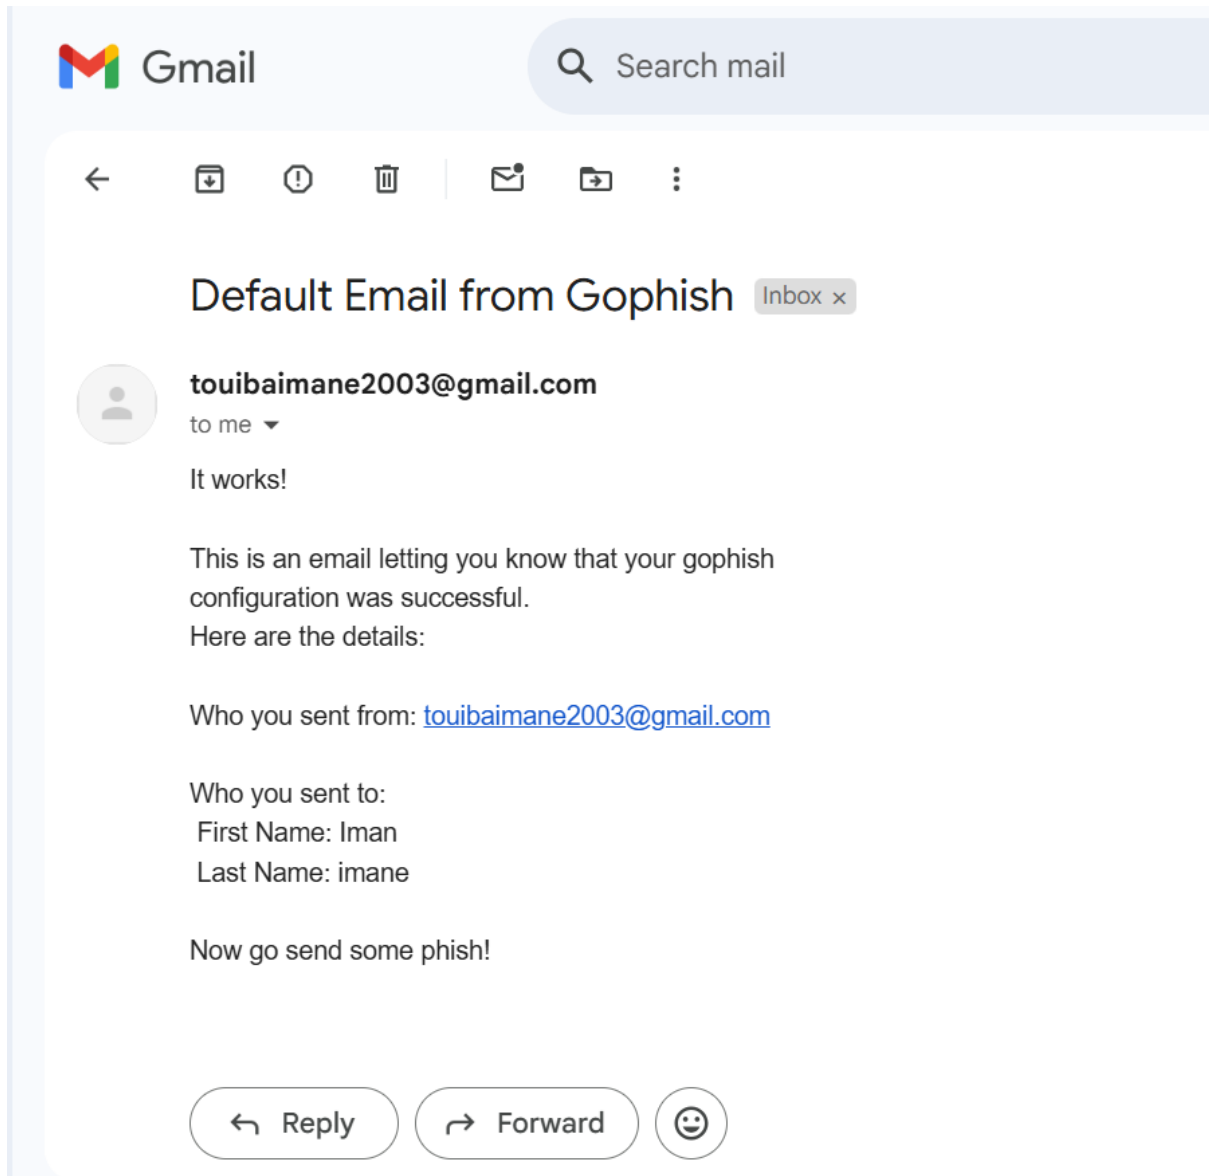

- Name:** A text input field containing 'Profil'.
- Interface Type:** A dropdown menu with 'SMTP' selected.
- SMTP From:** A text input field containing 'touiibaimane2003@gmail.com'.
- Host:** A text input field containing 'smtp.gmail.com:25'.
- Username:** A text input field containing 'touiibaimane2003@gmail.com'.
- Password:** A password input field with masked characters.
- Ignore Certificate Errors:** A checked checkbox with a help icon.
- Email Headers:** A section for adding custom headers, currently empty.

Sending test email to verify that the GoPhish configuration is functioning correctly

The screenshot shows the 'Send Test Email' modal in the GoPhish application. The modal displays a success message 'Email Sent!' and includes the following elements:

- Send Test Email to:** A section with three input fields: 'Imane', 'Touiba', and 'iman.imane.rca2003@gmail.com'. A 'Position' field is also present.
- Buttons:** 'Cancel' and 'Send' buttons.
- Table:** A table with columns 'Header' and 'Value'. It contains the message 'No data available in table' and 'Showing 0 to 0 of 0 entries'.
- Footer:** 'Cancel' and 'Save Profile' buttons.

Campaign Launch Name: "campain"

 ✉ Send Test Email

Groups:

5 Phishing attack

After launching the campaign, GoPhish successfully delivered the spoofed LinkedIn emails to both test users. One user clicked the link and submitted credentials (username:, password: password) through the Pyphisher-generated landing page, which were captured in creds.txt.
